Fadil Usman

ABSTRACT

The development of information technology has been developing so rapidly including the digital payment system. The intention of this research is to analyze the influence of variables of features and trust towards customer's decision to use the digital payment system in relating to the intention to use as the intervening variable. The data collection is by using the distribution of questionnaire and the population of the research is consisted of the customers of Go-Pay digital payment application in Jakarta, Indonesia. This is a descriptive and verification research, the descriptive methods is based on the assessment of analysis and the verification methods is based on the quantitative analysis. The sample determination is processed through the Purposive Sampling and the analysis technique is using Partial Least Square (PLS). The results show that features and trust have positive and significant effect towards intention to use, the feature of the application have the most significant influence towards intention to use compare to the trust of the application. The results show that Go-Pay is the digital payment applications in Indonesia which is frequently used by the customers because of the features and trust provided by the application, that is why Go-Pay is so popular that is being used by the customers.

Keywords: Features, Trust, Intention to Use, Decision to Use

INTRODUCTION

The fast development of technology in Indonesia as a development country has influenced the lifestyles of the people, the people have changed to the communication methods in their daily life activities, no matter where they are. There has been a tremendous change in the technologies development which can be classified as positively and negatively based on the benefit and advantages provided by these developments.

The development and innovations in technology have been in place to facilitate and support the community activities in almost every country. One of them is to bring in the digital payments and to replace the circulation of physical money for the customer to pay their transactions. The aim of this digital payment system is to help and provide easier process for the customers to make purchases and transactions without bringing along the physical money. In terms of security, the digital payment system can also prevent robbery and theft of money.

According to the regulation of the Bank of Indonesia (PBI) Number 20/6/ BI/2018 that digital payment or electronic money in the provisions of Article 1 Paragraph 3 explain that "Electronic Money/digital payment is a payment instrument that meets the following elements: a). issued on the basis of the value of money paid in advance to the issuer; b). the value of money is stored electronically in a media server or chip; and c). the value of electronic money managed by the issuer is not a deposit as referred to the Act of governing banking (bi.go.id). "

Based on the support from the government, the increase of transactions through electronic money is triggered by the benefits provided by the digital payment, for both the society and the industry. Several other advantages are: (1) the convenience of payment transactions which is more quickly and safely, (2) the problem of cash handling is solved to minimize the risk of robbery and theft, (3) to help the central bank controlling printing of physical money. These are the reasons why government of almost all countries are persuading and encouraging the people to used digital payment instead of physical money.

Figure 1 The Circulation of Digital Payment in Indonesia
Source: bi.go.id (2019)

Electronic money as a digital payment instrument is increasingly used in Indonesia, this was supported by the data obtained from the statistics of the Bank of Indonesia (BI) in terms of the number of transactions done from digital payment from 2012-2019 as explained in the figure Above. In 2012, the number of digital payments in the circulation in Indonesia has reached 21,869,946 transactions. Then in 2016, the number of transactions increased significantly to 51,204,580 transactions. And then in March 2019 the number continued to increase until it reached the number of 199,174,153 transactions. This shows that the use of digital payments in Indonesia continues to experience a significant increase.

Figure 2 The Most Popular Digital Payment in Indonesia
Sumber: katadata.co.id

According to the results of the survey conducted by YouGov Indonesia in 2018, Go-Pay digital payment application is the most popular digital payment application and are mostly used by the customer to pay their transactions. Based on the survey, 80% of the respondent prefer to choose Go-Pay as their digital payment application compare to Ovo Pay and Paypal as the second and third place after Go-Pay as shown in the figure above.

The aim of this research is to understand and to test the phenomenon about the increasing use of digital or cashless payments by the customers to pay for their transactions. The other reason is to understand how did Go-Pay lead the digital payments application and provide benefits to the customer so that customers have the intention to choose Go-Pay as their digital payment application compare to the rest of the digital payment application.

According to Ramli & Soelton (2018) that all companies need to develop the ability to apply innovation in developing products and processes to be different from their competitors in order to provide products and services to the customers. Therefore, consumers may be able to distinguish and choose between products and services that provide different abilities and advantages.

Research Gap

Based on several discussions of previous studies, which according to Kartika & Nugroho (2015) stated that the results of his research showed that the volume of electronic money transactions increased in ASEAN countries, while the circulation of physical money decreased dramatically. Wulandari et al (2016) examined the intensity of electronic money use, transaction volume, preferences, and perceptions about the use of electronic money in Malang. Vlasov (2017) concluded that cryptocurrency has several advantages when compared to other forms of money. Saraswati and Muklis (2018) explained that credit cards and e-money had a positive effect compared to debit cards in currency demand in Indonesia. Nugroho et al (2018) conveyed in their research that attitudes, subjective norms and behavioral control have a positive influence on consumer interest in using electronic money. Khalaf (2018) electronic money is the latest discovery of payment methods which is a major challenge faced by the central bank in handling financial policies. O'Dwyer (2019) in his research explained that the status of money as a memory technology is very important in reminding the role played by information and communication technology in economic transactions. Islam & Baten

(2019) concluded that the requirements of sophisticated technology infrastructure must have safe and user-friendly software with high-speed internet services identified as the main challenge to e-money in the future.

Based on the results of studies of from several previous studies on the digital payments application, it was revealed that most of the research are analysing more on the theoretically side that show the research gap, in this research the author will put more efforts on the empirical study based on the field observations and the methodological study based on the constructed variables of features, benefits, decision to use and intention to use, where generally from the research more theoretically explained which is a research gap that can be found, so the author feel the need to conduct research and study empirically through a methodology of the interest in using electronic payment applications about features and the benefits of the application where the customers might choose to use compare to the rest of the applications.

LITERATURE REVIEW

Features

Kotler & Armstrong (2016: 262) states that features are one of the competitive tools to differentiate a company's products compared to its competitors' products. Being first to introduce valuable new features is one of the most effective ways to compete. Du et al (2015) explain that the idea of many factors is beyond the control of marketers and can cause a relative shift in the interests of various product features in shaping consumer purchasing decisions. This shift can change the relative attractiveness of products with different levels of features.

Trust

Budiantara et al (2019) explain that Trust is "the willingness of consumers that depend on other parties and be vulnerable to other parties' actions during a certain process, with the hope that the other party will adopt acceptable practices and will be able to provide the products and services that they have promised". According to Kotler & Armstrong (2016: 181) that belief is a descriptive thought that someone has about something. Beliefs may be based on real knowledge, opinions, or faith and may or may not bring about emotional. Marketers will be interested in the beliefs that people formulate about certain products and services because these beliefs shape the image of products and brands that influence consumer buying behavior.

Intention to Use

Rekarti & Hertina (2014) explained that interest in using is intention, generally defined as a deep desire to do something that is preferred. An individual who knows information about an online site can make him interested to do something related to which causes a sense of interest. According to Kotler & Armstrong (2016: 185) that consumers can form purchase and use interests based on factors such as expected income, expected prices, and expected product benefits. However, unexpected events can change your purchase and usage interests. As such, preferences and even interest in buying and using do not always result in actual purchasing and usage choices.

Decision to Use

Prasetyaningsih & Astini (2016) explained that the decision to use is the next stage after the intention or desire to buy but the decision to use is not the same as the actual usage. Decisions to use by consumers vary greatly, some are simple and some are complex. According to Prasetyaningsih & Astini in Kotler & Keller (2009) stated that the decision-making process using can be divided into five stages, namely: problem recognition, information search, alternative evaluation, decision to use and behavioral use. According to Kotler & Armstrong (2016:183) that after seeing the influence that can affect buyers, marketers must look at how consumers make purchasing decisions. The buyer decision process consists of five stages: introduction of needs, information seeking, alternative evaluation, purchasing decisions, and post-purchase behavior. Marketers need to focus on the entire buying decision process rather than just focusing on the buying decision.

Research Hypothesis and Framework

1. The influence of features towards intention to use

Du et al (2015) explain that the idea of many factors is beyond the control of marketers and can cause a relative shift in the interests of various product features in shaping consumer purchasing decisions. Rekarti & Hertina (2014) explained that interest in using is intention, generally defined as a deep desire to do something that is preferred. Thus, the hypotheses that can be formulated in this study are as follows:

H₁: The influence of features towards intention to use.

2. The influence of trust towards intention to use

Nguyen et al (2013) explain that over the past decade, the concept of trust has attracted much attention among researchers, especially in organizational theory and marketing. Rekarti & Hertina (2014) explained that interest in using is intention, generally defined as a deep desire to do something that is preferred. Thus, the hypotheses that can be formulated in this study are as follows:

H₂: The influence of trust towards intention to use.

3. The influence of features towards decision to use

Du et al (2015) explain that the idea of many factors is beyond the control of marketers and can cause a relative shift in the interests of various product features in shaping consumer purchasing decisions. Prasetyaningsih & Astini (2016) explained that the decision to use is the next stage after the intention or desire to buy but the decision to use is not the same as the actual usage. Thus, the hypotheses that can be formulated in this study are as follows:

H₃: The influence of features towards decision to use.

4. The influence of trust towards decision to use

Nguyen et al (2013) explain that over the past decade, the concept of trust has attracted much attention among researchers, especially in organizational theory and marketing. Prasetyaningsih & Astini (2016) explained that the decision to use is the next stage after the intention or desire to buy but the decision to use is not the same as the actual usage. Thus, the hypotheses that can be formulated in this study are as follows:

H₄: The influence of trust towards decision to use.

5. The influence of intention to use towards decision to use

Rekarti & Hertina (2014) explained that interest in using is intention, generally defined as a deep desire to do something that is preferred. Prasetyaningsih & Astini (2016) explained that the decision to use is the next stage after the intention or desire to buy but the decision to use is not the same as the actual usage. Thus, the hypotheses that can be formulated in this study are as follows:

H₅: The influence of intention to use towards decision to use.

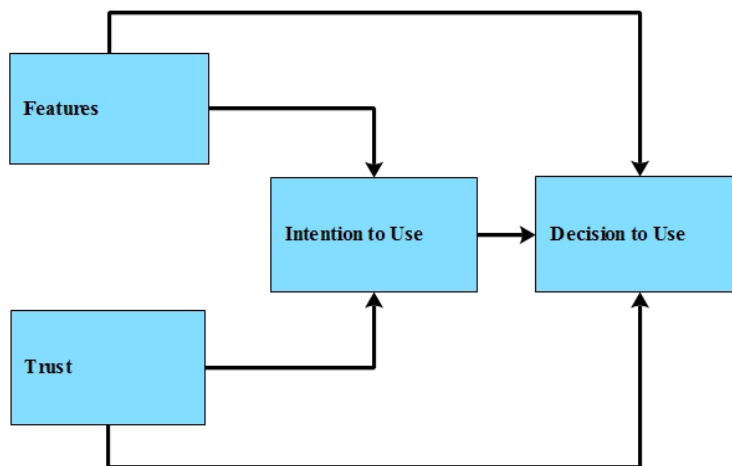

Figure 3 Research Framework

METHOD

The research designed in this study is using strategic marketing management approach that includes the operationalization variables, data collection method and information collection, defining the population, calculating the sample size and sampling techniques. The design of the analysis conducted in the testing research hypothesis is by conducting the study of the customers of Go-Pay digital payment application in Jakarta, Indonesia.

The formulation and purpose of this study is to describe and reveal the interrelationship between the research variables explained above. This research is using descriptive and verification method with the type of causal investigation on the relationship and influence between the exogenous and endogenous variables.

The process of observation in this research is using time horizon with cross section/one shot, the collective data is obtained through the research done in 2020, the unit of the analysis is Go-Pay digital payment application located in Jakarta, Indonesia. The observation unit is the customers using Go-Pay digital payment application located around Jakarta. The design of analysis used is to test the hypothesis and to examine the relationship between the research variables by using *Partial Least Square (PLS)*, one of the alternative method of structural analysis from *Structural Equation Modeling (SEM)*.

The validity testing was done by using the sample of 250 respondents randomly on the customers of Go-Pay digital payment application. The attempt of this validity testing is to find out the eligible of the selected items including the overall data collection process.

The reliability test of this research data is using Cronbach’s Alpha coefficient method. The Cronbach’s Alpha coefficient is the reliability coefficient most commonly used because coefficient will indicate the variance of items with either correct or incorrect format such as Likert scale format. The Cronbach’s Alpha coefficient is mostly used to evaluate internal consistency.

RESULTS AND DISCUSSION

Results

The results of descriptive analysis conducted on the customer of Go-Pay digital payment application to find out that the intention to use the digital payment based on the features and trust of the digital payment application. According to the above-mentioned independent variable then continue to find out the most significant influence of the variables towards the dependent variable of decision to use of the customers against the digital payment application.

The measurement model of analysis above show the correlation between the manifest variables (indicators) with each of the latent variables. The analysis of this measurement model is to test the validity and reliability of between the dimensions and the indicators of the variables constructed earlier. The analysis of the measurement model will indicate the value of the discriminant validity by looking at the value of the square root of Average Variance Extracted (AVE) with the suggestion value above 0,5, loading factor (>0.5), and constructed Composite Validity and Reliability (Cronbach's Alpha >0.70), all this measurement has concluded that the dimensions and indicators are classified as reliable. As showed below:

Table 1 Goodness of Fit Model (GoF)

Variable	AVE	Composite Reliability	Cronbach's Alpha	R Square	Q Square
Features	0,547	0,857	0,911	-	0,641
Trust	0,768	0,930	0,900	-	0,359
Intention to Use	0,639	0,916	0,893	0,516	0,484
Decision to Use	0,677	0,928	0,796	0,641	0,173

Source: From Data Processing (2020)

The value of R² shows in the table above is considered to be strong, with large Q value, this figure has also concluded that the propose model are supported by the empirical research which is classified as *fit*. Similarly, the value of AVE is >0.5, this indicate that all the variables in the model are estimated to meet the cirteria of discriminant validity. The value of both Composite Reliability and Cronbach's Alpha for each of the variables are >0.70, which means that all the researched variables are classified as reliable and the outer model of this research is also classified as *fit*.

The result of measurement based on the data processing of model analysis on the dimensions indicates that the overall indicators that are used to be processed above are classified as valid, as most of the value from the loading factors are greater than 0.70.

The model of latent variables against the dimensions as explain above indicate that the validity of the dimensions is in order to measure the research variables. The following table shown below present the results of the measurement model analysis of each of the latent variable against the dimensions.

Table 2 Loading Factor Between Latent Variables and Dimensions

Latent Variables-Dimensions	Loading factor (λ)	Standard Error (SE)	T Statistics ($ \lambda/SE $)
Features → Diversity	0.870	0.041	12.742
Features → Usability	0.884	0,04	18.787
Features → Convenience	0.880	0,033	19.523
Trust → Integrity	0.786	0.041	26.251
Trust → Honesty	0.748	0.035	28.542
Trust → Goodness	0.769	0.039	26.648
Intention to Use → Expected Benefits	0.825	0.052	25.654
Intention to Use → Expected Usability	0.707	0.047	22.841
Intention to Use → Expected Profit	0.877	0.043	22.451
Decision to Use → Need Recognition	0.669	0.041	17.458
Decision to Use → Information Search	0.528	0.052	25.425
Decision to Use → Evaluation of Alternatives	0.675	0.061	15.652
Decision to Use → Decision to Use	0.684	0.045	13.326
Decision to Use → Postusability Behavior	0.714	0.049	15.269

Source: From Data Processing (2020)

The results of the measurement model analysis of the research variables against the dimensions from the table above shows that almost all of the dimensions are valid with the value of the t count >t table (2.01).

The estimated value of the path analysis in the structural model must be significant. This significant value can be obtained from the bootstrapping procedure in the data analysis. The significance of the hypothesis is by looking at the value of the parameter coefficient and the significance value of the T-statistics on the bootstrapping algorithm report. In order to find out the significant or not significant can be seen from the T-table at alpha 0.05 (5%) = 1.96. Then, T-tables are to compare with the T-counts (T-statistics) as explained below.

Table 3 The Result of Hypothesis Testing

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (O/STDEV)	P Values
Features → Intention to Use	0,112	0,118	0,087	1,295	0,196
Trust → Intention to Use	0,419	0,415	0,093	4,522	0,000
Features → Decision to Use	0,344	0,345	0,070	2,948	0,000
Trust → Decision to Use	0,133	0,139	0,058	2,310	0,021
Intention to Use → Decision to Use	0,144	0,144	0,079	1,821	0,069

Source: From Data Processing (2020)

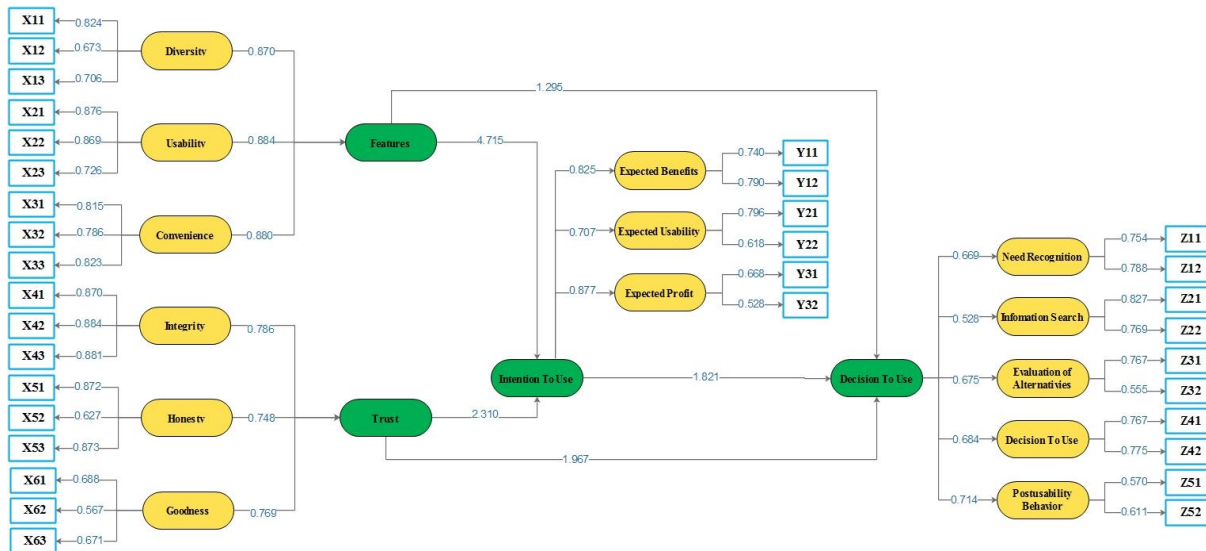

Figure 4. Hypotesis Testing
Source: From Data Processing (2020)

From the results of hypothesis testing, it was revealed that the independent variable of features has the highest influence towards the intervening variable of intention to use compared to the other independent variable of trust. The variabel feature also has the highest influence against the dependent variable of decision to use rather than the other independent variable of trust. While intention to use as the intervening variable is also an important factor in determining the effect of the dependent variable of decision to use.

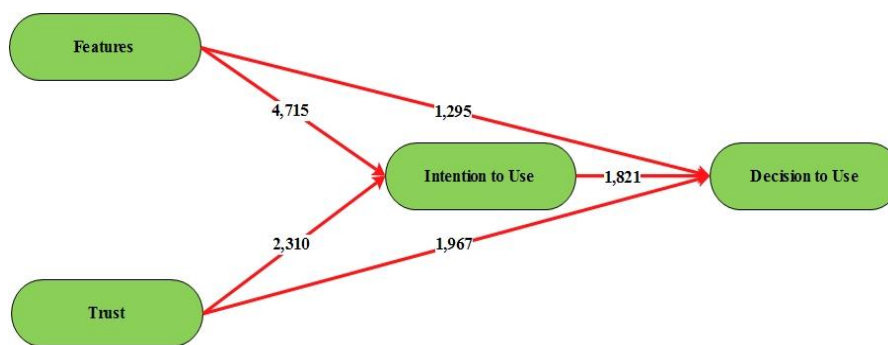

Figure 5 Testing Result
Source: From Data Processing (2020)

Based on the testing results above, the research variables indicate that the independent variable of feature has the most significant influence towards the variable of intention to use as the intervening variable with the figure of 4,715, compare to the other independent variable of trust with the figure of 2,310. The direct effect of the independent variable of trust has contributed higher influence towards decision to use as the dependent variable with the figure of 1,967 compare to the direct effect of the independent variable of feature with the figure of 1,295. Intention to use as the intervening variable also contribute a positive effect on decision to use as the dependent variable with the figure of 1,821 which means the intervening variable has a significant effect on the decision to use of Go-Pay digital payment application.

Discussion

1. The influence of features towards intention to use

Based on the testing results, it shows that features has a positive and significant influence towards intention to use. The results of the analysis show that the T-statistic value is 4,715 with the original sample 0,112. The Y-statistics value is larger than the T-table 1,96 and original sample is positive which means that the customer of Go-Pay has the intention to use based on the features offered by Go-Pay digital payment application.

2. The influence of trust towards intention to use

Based on the testing results, it shows that trust has a positive and significant influence towards intention to use. The results of the analysis show that the T-statistic value is 2,310 with the original sample 0,247. The Y-statistics value is larger than the T-table 1,96 and original sample is positive which means that the customers of Go-Pay has the intention to use based on the trust offered by Go-Pay digital payment application.

3. The influence of features towards decision to use

Based on the testing results, it shows that features has a positive and significant influence towards decision to use. The results of the analysis show that the T-statistic value is 1,295 with the original sample 0,166. The Y-statistics value is larger than the T-table 1,96 and original sample is positive which means that the customers of Go-Pay has decided to use based on the features offered by Go-Pay digital payment application.

4. The influence of trust towards decision to use

Based on the testing results, it shows that trust has a positive and significant influence towards decision to use. The results of the analysis show that the T-statistic value is 1,967 with the original sample 0,249. The Y-statistics value is larger than the T-table 1,96 and original sample is positive which means that the customer of Go-Pay has decided to use based on the trust offered by Go-Pay digital payment application.

5. The influence of intention to use towards decision to use

Based on the testing results, it shows that intention to use has a positive and significant influence towards decision to use. The results of the analysis show that the T-statistic value is 1,821 with the original sample 0,248. The Y-statistics value is larger than the T-table 1,96 and original sample is positive which means that the customers of Go-Pay has decided to use based on Go-Pay digital payment application

CONCLUSION, IMPLICATION AND LIMITATION

Conclusion

The research hypothesis constructed from this study is based on the four research variables: features and trust as the independent variables, decision to use as the dependent variable and intention to use as the intervening variable. Based on the results of the above framework, it can be concluded that the variable feature has the highest influence on intention to use compare to variable of trust. The variable of trust has the highest influence directly to decision to use compare to the variable of features.

The objectives of this research is to find out how does the Go-Pay digital payment application attract the customers to chooses their application compare to the rest of the compaitors. This research has constructed four researched variables to find out the intention to use of the digital payment application.

Based on the hypothesis testing, it can be concluded as follows:

1. Customers choose Go-Pay digital payment application as their digital payment because of the various benefits offer by the application and avoid using cash payment.
2. Customers understand that Go-Pay payment application can be use to pay many types of transactions offer in the application.
3. Customer also understand that Go-Pay payment application is a trusted digital payment application to protect the safety of the payment transactions.
4. Customers also realize that Go-Pay payment application has been working together with a lot of merchants for transactions.
5. Customers also have been using the application and understand the features of the application that are easily apply.
6. The finding also show that Go-Pay digital payment application continues to innovate based on the customer requirements.

Implication

The study of this research has generated several theoretical and practical implications such as:

1. The constructed variables of features and trust have positive and significant effect towards the intention to use of the digital payment application. This result has strengthened and enhance the amount of scientific literature within the scope of strategic marketing concept. The results show that strategic marketing concept can help to participate and contribute on the competitive advantage compare to the competitors.

2. The results of this study also indicate that the variables of features and trust have positive and significant effect towards the decision to use of the digital payment application. This result has strengthened and enhance the amount of scientific literature within the scope of strategic marketing concept. The results show that strategic marketing concept can help the customer to choose and decide which application they are going to choose.
3. The results of this study also indicate that the variables of features and trust have positive and significant effect towards the decision to use in relating to Go-Pay digital payment application. This result has strengthened and enhance the amount of scientific literature within the scope of strategic marketing management and also pointed out that applying strategic marketing is one of the ways to help how to compete with the competitors to win the competitions to acquire the competitive advantage of the company.

Limitation

This study is limited to analysing the customers who choose Go-Pay as their digital payment application. This research is also limited with the variable of features and trust concerning the intention to use of the digital payment application, there might be further analysis of variables with a larger population coverage. There are further investigate that can be done concerning the advantage and disadvantages of the digital payment application and also the security of the system wise.
